

A VISION FOR NORTH AMERICAN ENERGY

The world is facing a huge challenge: we must continue to meet the rising demand for energy while reducing global emissions.

A resurgence of geopolitical instability has sparked a renewed focus on national energy security around the world, but the reality is that no country can solve this global energy challenge alone.

- ▣ **Natural resources are not evenly distributed across nations.**
- ▣ **Energy supply chains are international and complex.**
- ▣ **Emissions do not respect national borders.**

Drawing from TC Energy's experience moving energy throughout Canada, the United States and Mexico, we see the enormous potential for regional energy solutions. We see the transformative value of a Vision for North American Energy.

A strong, enduring energy partnership will elevate our region from a collection of energy-producing nations into a global powerhouse of energy solutions. We know that innovation is key to solving our energy challenges and we're building new connections across our North American footprint to accelerate the development of a next generation energy system. Together, we can strengthen energy security and accelerate new technology at home, while positioning us to export cleaner energy and new solutions around the world.

Our vision for North American energy includes:

- 1** Developing a regional energy agenda that includes cohesive energy incentives, regional emissions targets and a shared commitment to building critical energy infrastructure.
- 2** Expanding regional energy supply chains that help shield North America from geopolitical instability.
- 3** Establishing global partnerships to export cleaner energy and next generation energy technology to nations around the world.

The United States, Canada and Mexico have a long history of economic partnerships delivering shared prosperity. We can write a new chapter in North America's success story through a commitment to regional energy integration.
